

Test setup: 50% of VM's pinned to pCPU 0 and the rest to pCPU 1. Equal load on all vCPUs

— processor_usage
● pin_changes

Test setup: Each vCPU has equal affinity to all pCPUs. 50% vCPUs run heavy load and the remaining run a light load

Test Setup: All VMs begin requesting memory. First 2 VMs start releasing memory while the other 2 keep consuming.

Test Setup: First 2 VMs begin consuming memory. The first VM starts releasing memory, while the second continues consuming.
